Job Title: Blockchain Technology Advisor for Atomic Ownership Blockchains

I offer technical consulting (remotely) to companies that adopt Atomic Ownership Blockchains (AOB) technology.

Atomic Ownership Blockchains This is a world-leading blockchain technology, pioneered by me, which represents a game-changing leap forward compared to existing technologies. Its advanced nature is reflected in the following aspects:

1、**Centerless** This further decentralizes Bitcoin, giving all nodes equal rights and eliminating privileged roles. Each person has full control over their private affairs (payments) without needing the cooperation of miners.

2、**High security** Security is implemented at the cryptographic level. Double-spending attacks can be prevented without relying on wishful economic fantasies. It is also naturally immune to Sybil attacks.

3、**Strong scalability** Performance and capacity are indefinitely scalable. Grouping mechanisms effectively mitigate hardware bottlenecks related to data broadcasting and processing. Furthermore, the integration of Layer 2 Channels, analogous to the Lightning Network, bypasses the need for global broadcasting. Crucially, the system achieves these efficiencies without the energy-intensive PoW (Proof of Work) mechanism, ensuring a carbon-neutral footprint.

4、**Stablecoins** A stablecoin anchored by hashing power in a decentralized manner is equivalent to an electricity standard, provided that advancements in algorithms and hardware are disregarded.

All of the above aspects are world firsts and lead other technologies. Applicable to currencies (including CBDCs and stablecoins), business vouchers, product traceability, financial instruments, NFTs, RWAs, metaverse, etc.

AOB Principle Introduction

Consider a private blockchain that always has an owner. Only the owner has the right to add blocks; others can only read them. If the owner adds a block and writes in the block, "I want to give this chain to Alice," then Alice becomes the owner of the chain. Now Alice has the right to add the next block and then give it to someone else.

This blockchain can clearly record its ownership. When there are multiple such chains, they can circulate in parallel without interfering with each other. This constitutes an extremely decentralized scenario. Since private chains plus blocks do not require consensus algorithms, performance and capacity can be horizontally scaled.

Each chain serves as a ledger for the atomic transfer of a specific asset. By assigning distinct physical or functional meanings to different chains, a wide array of use cases emerges. For instance, mapping each chain to a unique banknote creates an idealized cryptocurrency, while others could represent tangible goods, specific transactions, or digital identities.

Optional non-competitive PoW minting serves as a value anchor, ensuring that the currency is pegged to a stable volume of hash operations. Stablecoins achieved through this mechanism maintain an unparalleled level of decentralization.

Personal information

Born in 1979.1

1996 – 2000: Department of Computer Science, Beijing University of Posts and Telecommunications.

2000 – 2018: Microcontroller development, Python server-side development, web full-stack development.

2018 – Now: The pioneering of AOB and [Carnot Heat Engine](#) Apply for patents and promote the technologies.

Address: Shibalidian, Chaoyang District, Beijing, China.
